Support Documentation: Estimation of Uranium-235 Surface Soil Concentrations  
Based on Mass Unrecovered at the BORAX-I Burial Grounds

Dear Jean:

IT is pleased to submit the attached documentation to support estimation of possible uranium (U)-235 surface soil concentrations and activities based on the mass of U-235 unrecovered at the BORAX-I burial ground. This information was developed as a result of public comment on the SL-1 and BORAX-I proposed plan regarding the possibility for soil washing to recover the U-235 remaining at the site. Response to the comment involved estimation of the U-235 concentration in mg/kg. This idea was taken one step further to provide additional information for the uncertainty discussion in Section 6: the concentration of U-235 in mg/kg was converted to pCi/g for comparison to the soil sampling analytical data. The calc briefs detailing the estimates are attached.

Two different soil volumes were used in the estimates to provide a better understanding of the possible range of concentrations at the site. The first volume was based on the entire gravel-covered area (84,000 ft<sup>2</sup>) and a depth of one foot. The second volume (also one foot deep) was restricted to the areas found with radiological fields above 20  $\mu$ R/hr in surveys conducted in 1978 (14,700 ft<sup>2</sup>). A soil density of 1.5 g/cm<sup>3</sup> was assumed, consistent with the density used in the baseline risk assessment for BORAX-I. Results of the calculations are presented in Table 1.

Table 1. Estimated U-235 surface soil concentrations and activities.

Soil Volume (cubic feet)	Concentration (mg/kg)	Activity (pCi/g)
84,000	1	2
14,700	6	13

**Attachment 1**

**Calc Brief: BORAX-I Surface Soil Uranium Concentration**

## BORAX-I Surface Soil Uranium Concentration

**Purpose:** To determine the concentration of uranium in the surface soils in mg/kg.

**Assumptions:** The soils contain 3.7 kg of uranium evenly distributed throughout two different volumes of surface soil: an area of 84,000 ft<sup>2</sup> to a depth of 1 ft, and 14,700 ft<sup>2</sup> to a depth of one foot (see attached figure).

The soil density is 1.5 g/cm<sup>3</sup>.

**Calculation:** 84,000 ft<sup>3</sup> volume

mg of uranium:

$$3.7 \text{ kg} \left( \frac{10^6 \text{ mg}}{\text{kg}} \right) = 3.7 \times 10^6 \text{ mg.}$$

kg of soil:

$$84,000 \text{ ft}^3 \left( \frac{12 \text{ in}}{\text{ft}} \right)^3 \left( \frac{16.387 \text{ cm}^3}{\text{in}^3} \right) = 2,378,605,824 \text{ cm}^3$$

$$\begin{aligned} 1.5 \text{ g/cm}^3 (2,378,605,824 \text{ cm}^3) &= 3,567,908,736 \text{ g} \\ &= 3,567,908.736 \text{ kg} \end{aligned}$$

uranium concentration based on 84,000 ft<sup>3</sup>:

$$\text{concentration} = \frac{3.7 \times 10^6 \text{ mg}}{3,567,908.736 \text{ kg}} = 1.037 \text{ mg/kg}$$

**BORAX-I Surface Soil  
Uranium Concentration  
Continued**

**Calculation:** 14,700 ft<sup>3</sup> volume

kg of soil:

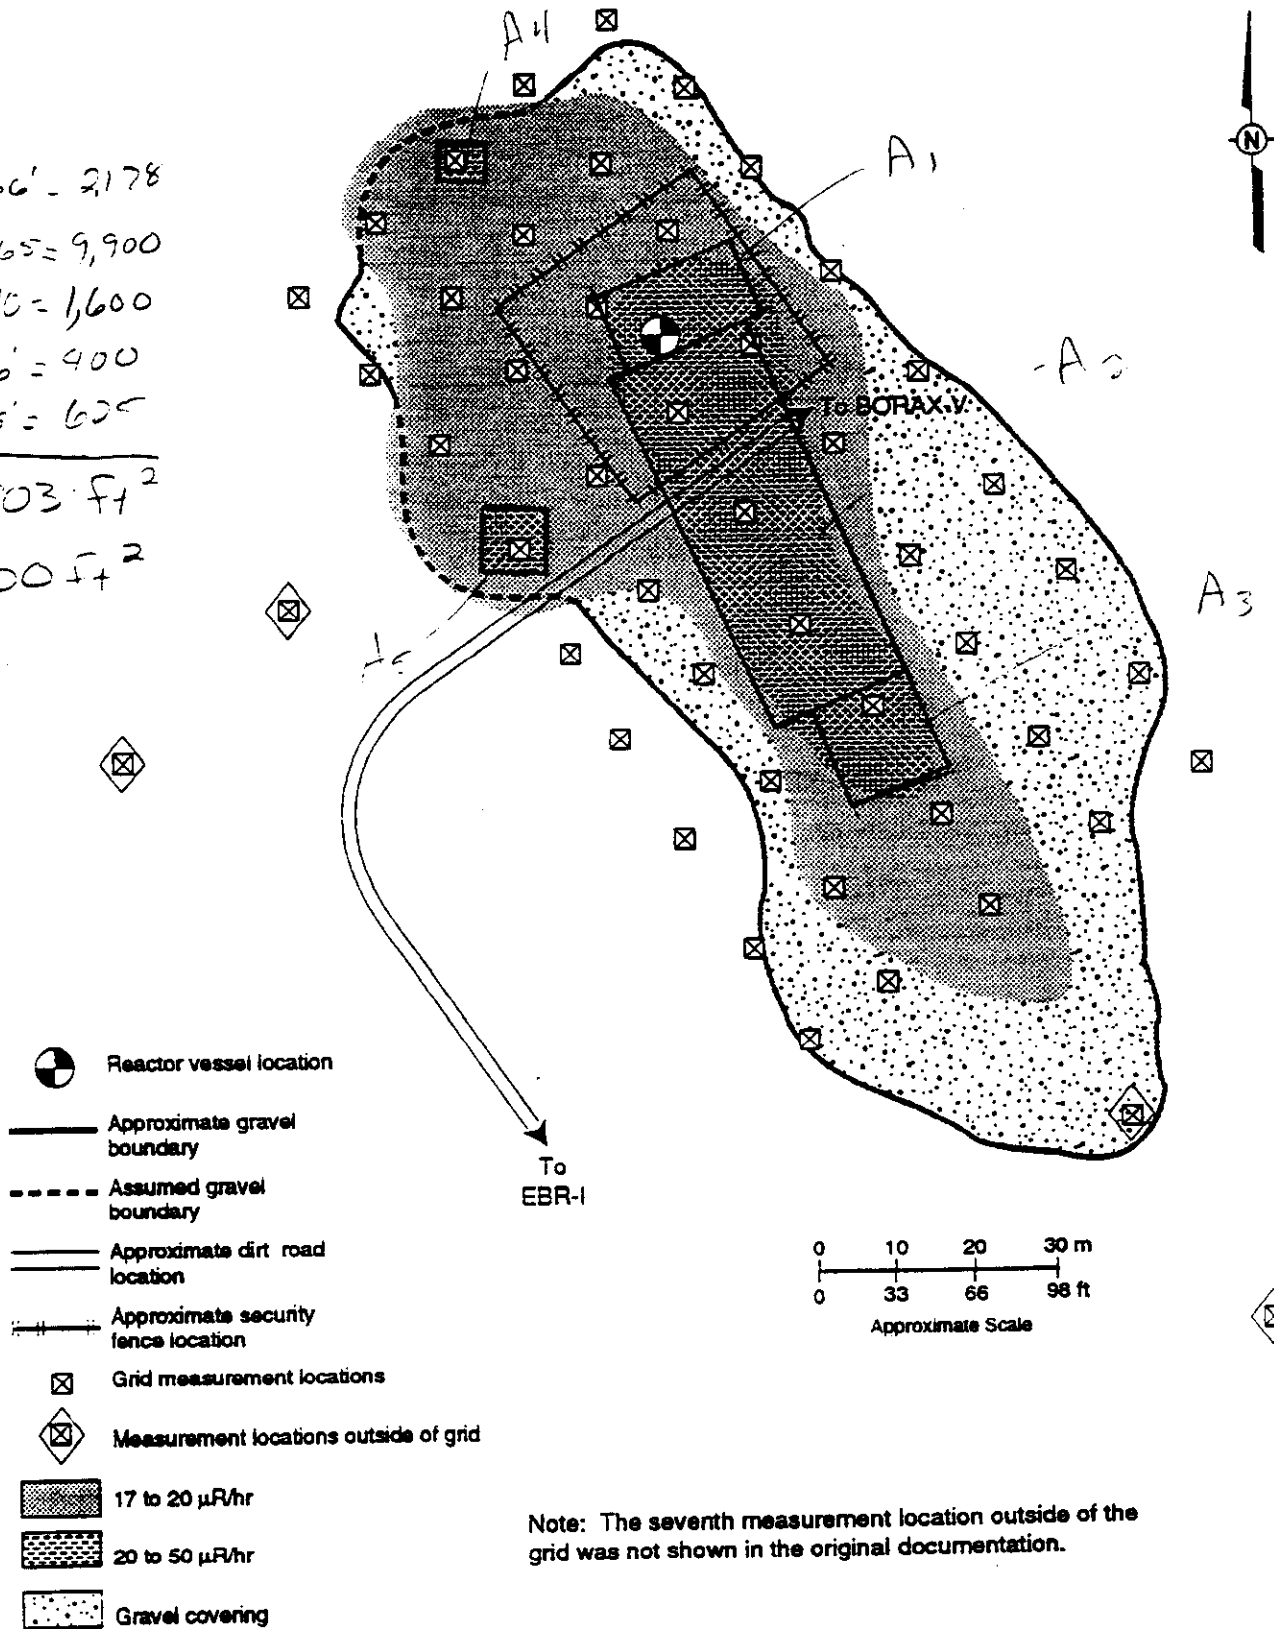

$$14,700 \text{ ft}^3 \left( \frac{12 \text{ in}}{\text{ft}} \right)^3 \left( \frac{16.387 \text{ cm}^3}{\text{in}^3} \right) = 416,256,019.2 \text{ cm}^3$$

$$\begin{aligned} 1.5 \text{ g/cm}^3 (416,256,019.2 \text{ cm}^3) &= 624,384,028.8 \text{ g} \\ &= 624,384.03 \text{ kg} \end{aligned}$$

uranium concentration based on 14,700 ft<sup>3</sup>:

$$\text{concentration} = \frac{3.7 \times 10^6 \text{ mg}}{624,384.03 \text{ kg}} = 5.9 \text{ mg/kg}$$

$$\begin{aligned}
 A_1 &\approx 33' \times 66' = 2,178 \\
 A_2 &\approx 10' \times 165' = 9,900 \\
 A_3 &\approx 40' \times 40' = 1,600 \\
 A_4 &\approx 25' \times 16' = 400 \\
 A_5 &\approx 25' \times 25' = 625 \\
 \hline
 &= 14,703 \text{ ft}^2 \\
 &\approx 14,700 \text{ ft}^2
 \end{aligned}$$

Exposure rate isoplethic map for the BORAX-I reactor area.

**Attachment 2**

**Calc Brief: BORAX-I Surface Soil Uranium Activity**

### **BORAX-I Surface Soil Uranium Activity**

**Purpose:** To determine the uranium activities in pCi/g based on the concentrations in mg/kg as determined in Attachment 1.

**Reference:** *Radiological Health Handbook*, Revised Edition, January 1970 (see attached).

**Given:** The specific activity of U-235 is  $2.14 \times 10^6$  pCi/g (*Radiological Health Handbook*, see attached).

**Calculation:** Based on U-235 soil concentration of 1.037 mg/kg

$$\left( \frac{1.037 \text{ mg}_{(U)}}{\text{kg}_{(soil)}} \right) \left( \frac{1 \text{ g}_{(U)}}{1,000 \text{ mg}_{(U)}} \right) \left( \frac{1 \text{ kg}_{(soil)}}{1,000 \text{ g}_{(soil)}} \right) (2.14 \times 10^6 \text{ pCi/g}_{(U)})$$
$$= 2.22 \text{ pCi/g}$$

**Calculation:** Based on U-235 soil concentration of 5.9 mg/kg

$$\left( \frac{5.9 \text{ mg}_{(U)}}{\text{kg}_{(soil)}} \right) \left( \frac{1 \text{ g}_{(U)}}{1,000 \text{ mg}_{(U)}} \right) \left( \frac{1 \text{ kg}_{(soil)}}{1,000 \text{ g}_{(soil)}} \right) (2.14 \times 10^6 \text{ pCi/g}_{(U)})$$
$$= 12.6 \text{ pCi/g.}$$
